Sprint 2

Our work for Sprint 2 was guided by Professor Meding's clarification on Piazza:

“We need to see the progress you made toward getting the application done. For example, what features got implemented or **planned out**. Were you late on committed items? Being late is perfectly fine and expected. However you have to document your plans to get them done.

From a retrospective point of view: how did the backlog change, was more detail required, did you have to break user stories into several pieces, how did you do that. Decisions you made as a team regarding the project.”

Although we had created a detailed plan in Notion during Sprint 1, including a backlog with numerous tasks, our team felt that we needed clearer direction before diving into technical tasks.

To address this, we focused on formally articulating our vision as a team. We held an in-person meeting where we spent extensive time mapping out the overall structure of our project. While we expect the design to evolve as development progresses, we agreed that establishing an initial visualization was a critical first step.

This visualization was informed by our existing work, including user stories and Notion tasks.

From a retrospective perspective, stepping back to hold this discussion proved essential.

Verbalizing our ideas and creating a shared vision ensured that we were aligned before beginning technical implementation. Without this alignment, proceeding directly with the backlog could have led to inefficiencies and unforeseen issues.

Now that we have a common understanding, we are ready to move forward with our backlog in the coming weeks.
